Under a White Blanket

Snow may feel cold, but it helps many animals live through winter. Fresh snow is full of tiny pockets of air. That air traps heat that rises from the ground. Under a thick layer of snow, the ground stays much warmer than the freezing air above. In this way, snow works like a fluffy blanket.

Mice and voles spend the winter under the snow. They run along tunnels in a thin space between the snow and the ground. Down there, they stay out of the icy wind. They nibble seeds, grass, and roots along the way. The snow on top also keeps them hidden while they move about.

Some bears sleep through most of the winter in dens. A den may be a cave, a hollow log, or a hole dug into a hill. When snow piles up over the den, it seals in the bear's body heat. The bear stays snug inside until spring.

Some birds even use snow as a bed. A bird called the ruffed grouse dives headfirst into soft, deep snow on very cold nights. It rests in a small snow cave, safe from the wind. In the morning, it bursts out in a puff of white and flies away.

1. What is the main topic of the whole text?
   - how mice run in tunnels under snow
   - how snow helps animals in winter
   - how bears get ready for winter

2. What is paragraph 2 mostly about?
   - how snow keeps the ground warm
   - how birds dive into snow at night
   - how small animals live under the snow

3. What is paragraph 3 mostly about?
   - how bears dig tunnels under snow
   - where bears find food in the fall
   - how snow keeps a bear's den warm

4. Which detail belongs in paragraph 4?
   - Mice can run through their snow tunnels all winter.
   - A mother bear may have cubs while she is in her den.
   - A bird called a ptarmigan also burrows into snow at night.
